

New methods for modeling and upscaling inflow performance of advanced well completions
Presented at the Annual ICT meeting in Houston 27/9/2024 by K. Brekke, PhD and K. Langaas, PhD

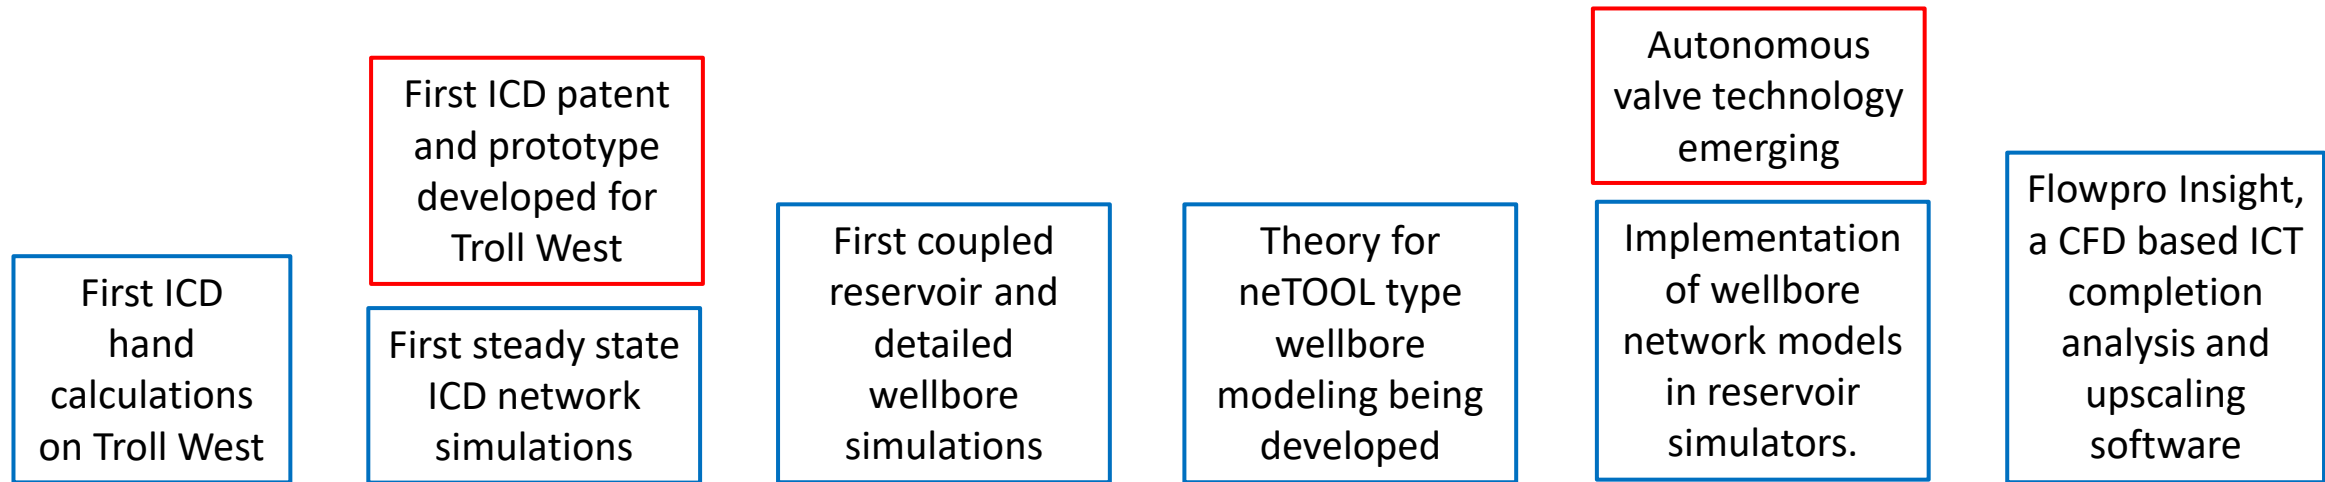

Insight
SOFTWARE

Outline

- ICT modeling history (from personal archive)
- The Insight ICT analysis and upscaling method
- Method validation (comparison with Ansys Fluent)
- Example reservoir modelling using the Insight work process (SPE-222361-MS at ADIPEC)

ICT Modeling History

1991

1992

1993

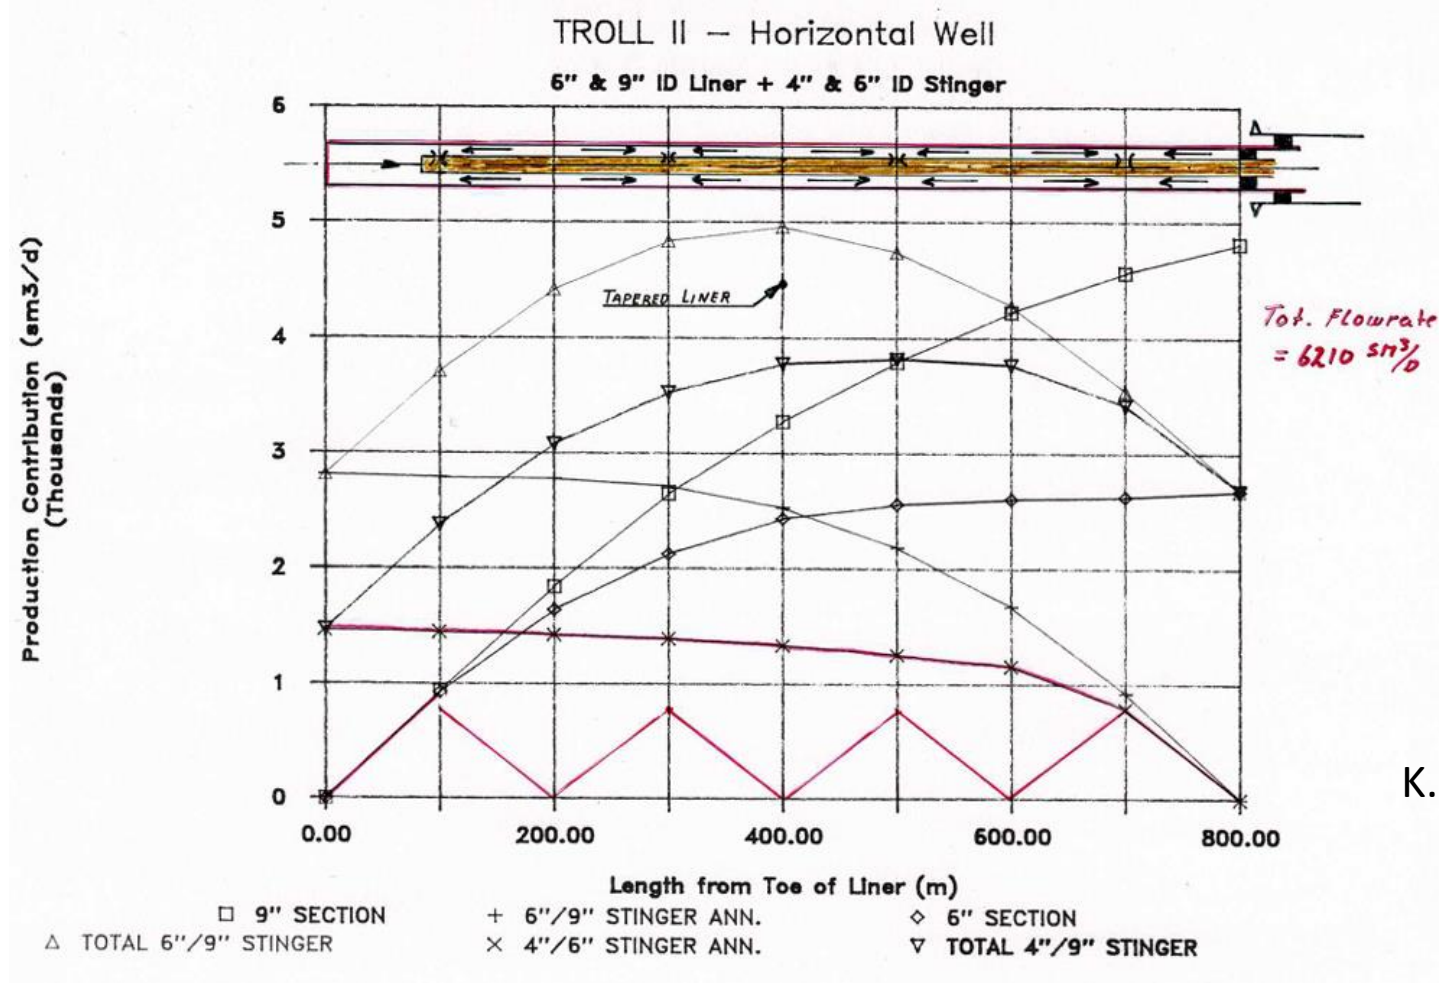

1994-1996

2019-2024

ICT Simulation Memorabilia (Norsk Hydro 1991)

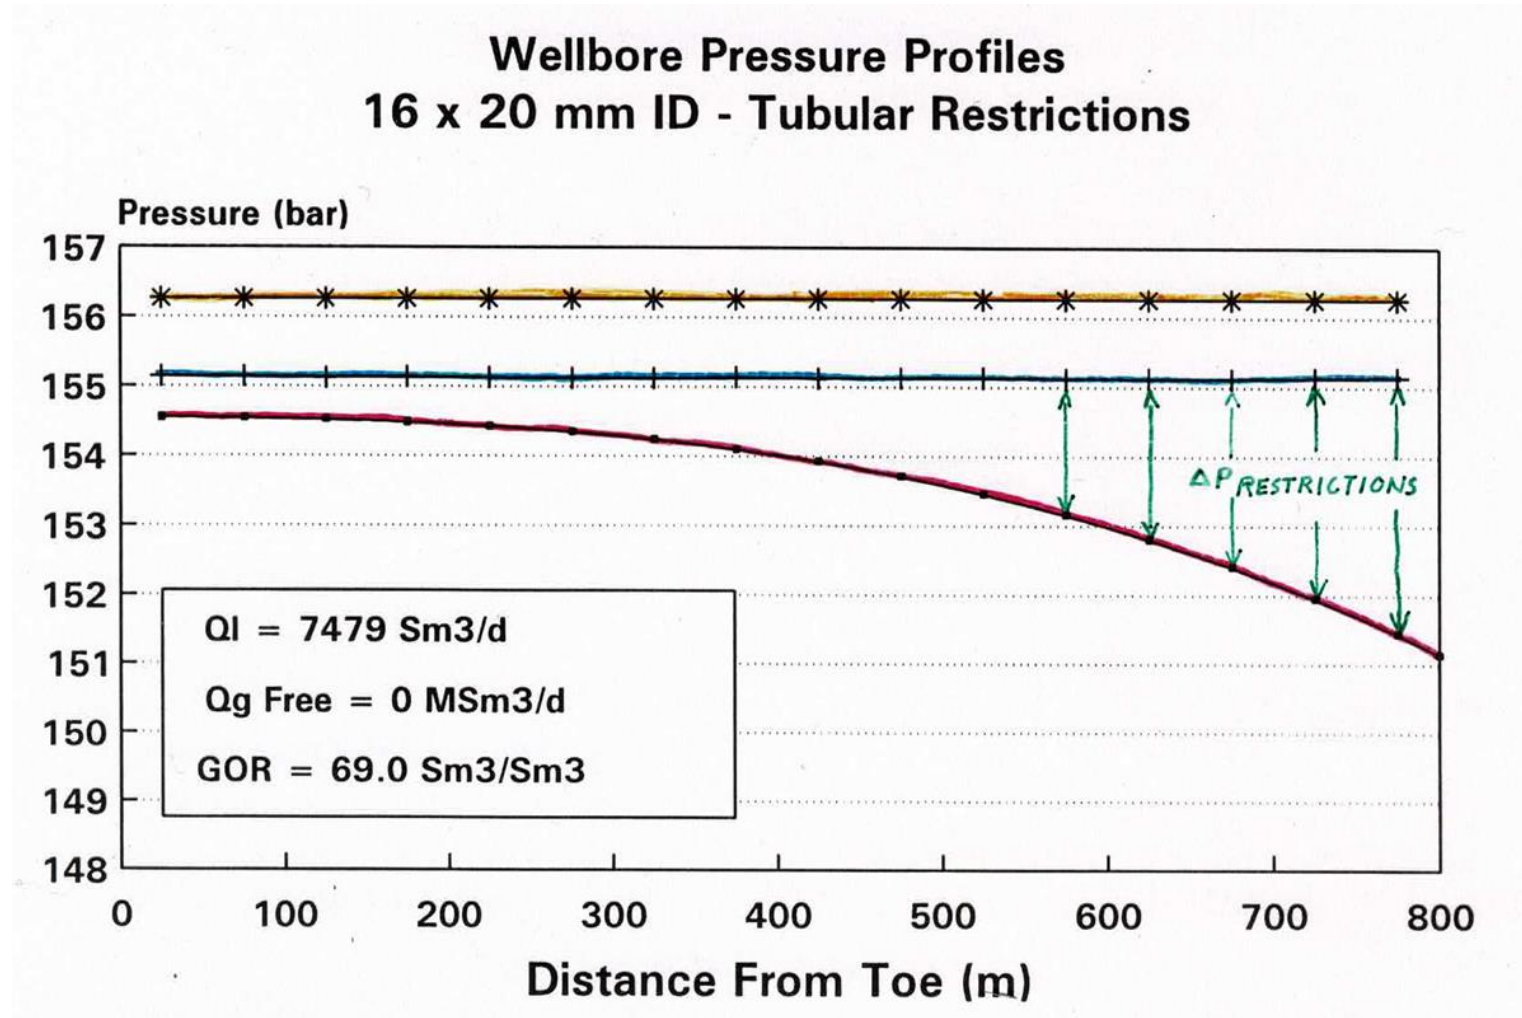

Drawings of hand calculated production performance in base pipe and annulus of Troll West well with ICT

K. Brekke

ICT Simulation Memorabilia (Norsk Hydro 1992)

HOSIM – First internal Norsk Hydro network model developed for HW ICT simulation
(Recycled gas flowline network simulator)

K. Brekke

ICT Memorabilia (Norsk Hydro 1992)

First ICD white paper

New, Simple Completion Methods for Horizontal Wells Improve Production Performance in High-Permeability Thin Oil Zones

Kristian Brekke and S.C. Lien, SPE 24762, 1992 ATCE

First ICD drawing (for prototype and patent)

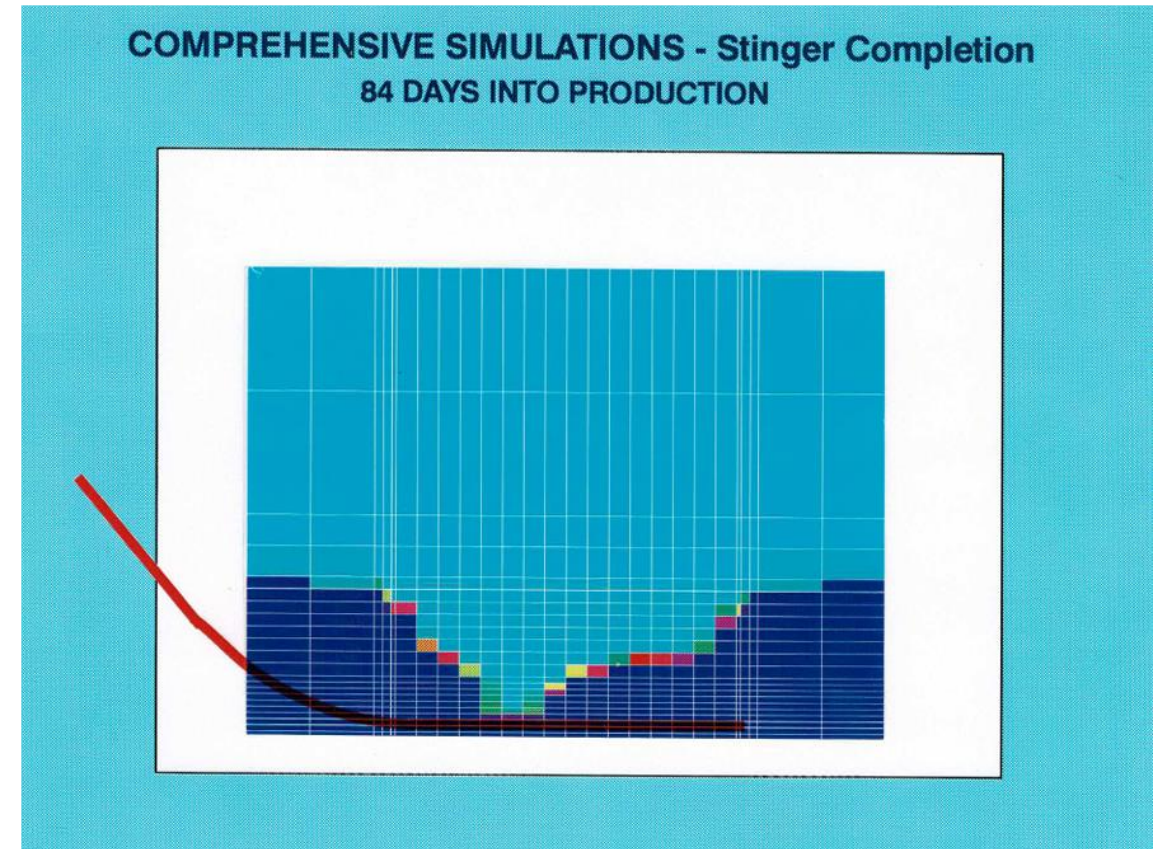

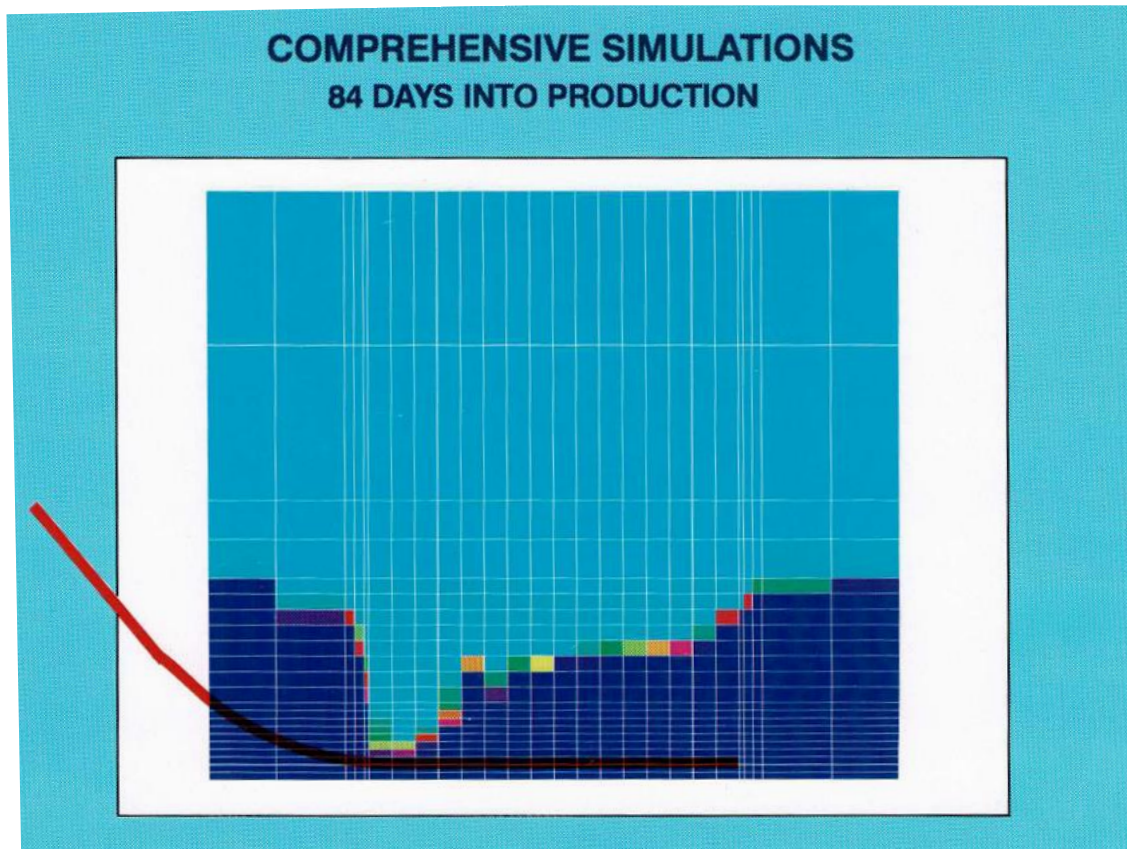

First ICD poster

ICT Simulation Memorabilia (Norsk Hydro 1993)

Coupled HW wellbore and reservoir simulation (HOSIM/Frontsim)

SPE 26518 "A New Modular Approach to Comprehensive Simulation of Horizontal Wells.": K Brekke

ICT Simulation Memorabilia (The University of Tulsa 1994-1996)

SPE36578 "Horizontal Well Productivity and Risk Assessment": K. Brekke – theory behind neTOOL

Network Simulator for Well and Reservoir Flow Predictions

Motivation for Flowpro Insight

- To simulate all types of inflow control technology correctly by including.
 - **Annulus phase segregation.**
 - **Valve interaction.**

- To efficiently include physically correct ICT performance in dynamic reservoir simulations.

Inflow Control Devices

ICD

AICV

AICD

ICV

DAR / D-AICD

Insight Main Features

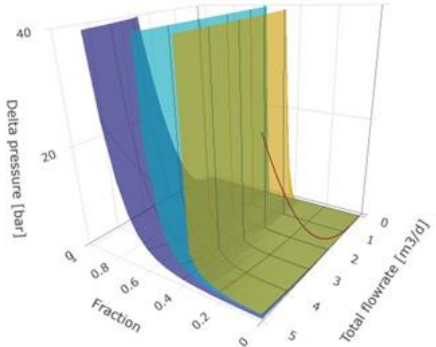

- Developed over 5 years in close collaboration with major operators.
 - Lundin, AkerBP, Vår Energi (Neptune), OMV
- Insight captures the physics of annulus phase segregation and valve interaction.
- Custom CFD – 3 million times faster than Ansys Fluent for a typical zone.
- Integrates upscaled zone inflow performance in reservoir simulators through the RCP equation or VFP tables.
- Automatic design of multi zone inflow control completions.
 - Type of ICT
 - Number and size of valves
 - Distribution of valves
- User friendly software with library of instructional videos

Valve

Valve response surface

Delta pressure [bar]

Fraction

Total flowrate [m³/d]

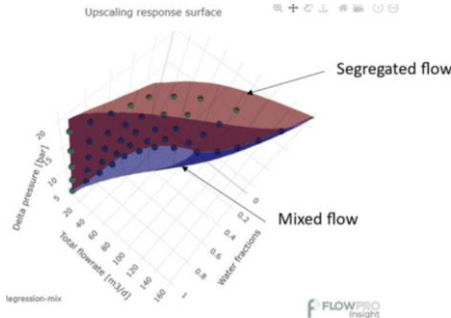

FLOWPRO

Detailed description: This block shows a 3D model of a valve on the left. To its right is a 3D surface plot titled 'Valve response surface'. The vertical axis is 'Delta pressure [bar]' ranging from 0 to 40. The horizontal axes are 'Fraction' (0 to 1) and 'Total flowrate [m³/d]' (0 to 5). The surface shows a sharp increase in pressure as flowrate increases, especially at higher fractions.

Zone

Upscaling response surface

Segregated flow

Mixed flow

Delta pressure [bar]

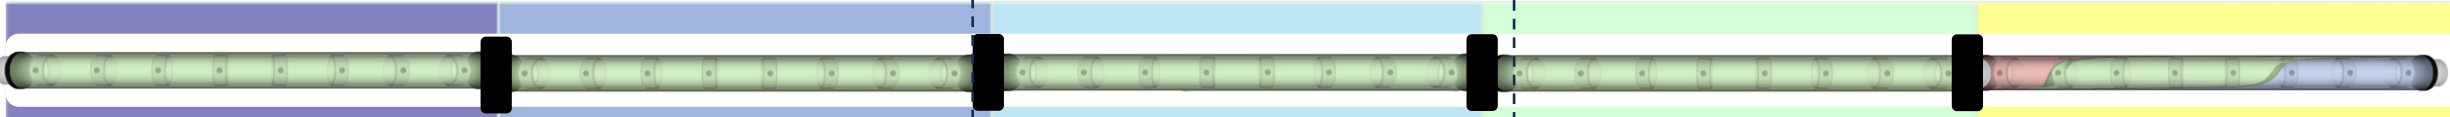

Total flowrate [m³/d]

Water fraction

regression-mix

FLOWPRO

Detailed description: A yellow arrow points from the valve to a 3D model of a wellbore zone. To the right is a 2D plot titled 'Upscaling response surface'. The vertical axis is 'Delta pressure [bar]' (0 to 15). The horizontal axes are 'Total flowrate [m³/d]' (0 to 100) and 'Water fraction' (0 to 1). The plot shows two regions: 'Segregated flow' (red) and 'Mixed flow' (blue). A legend at the bottom left indicates 'regression-mix'.

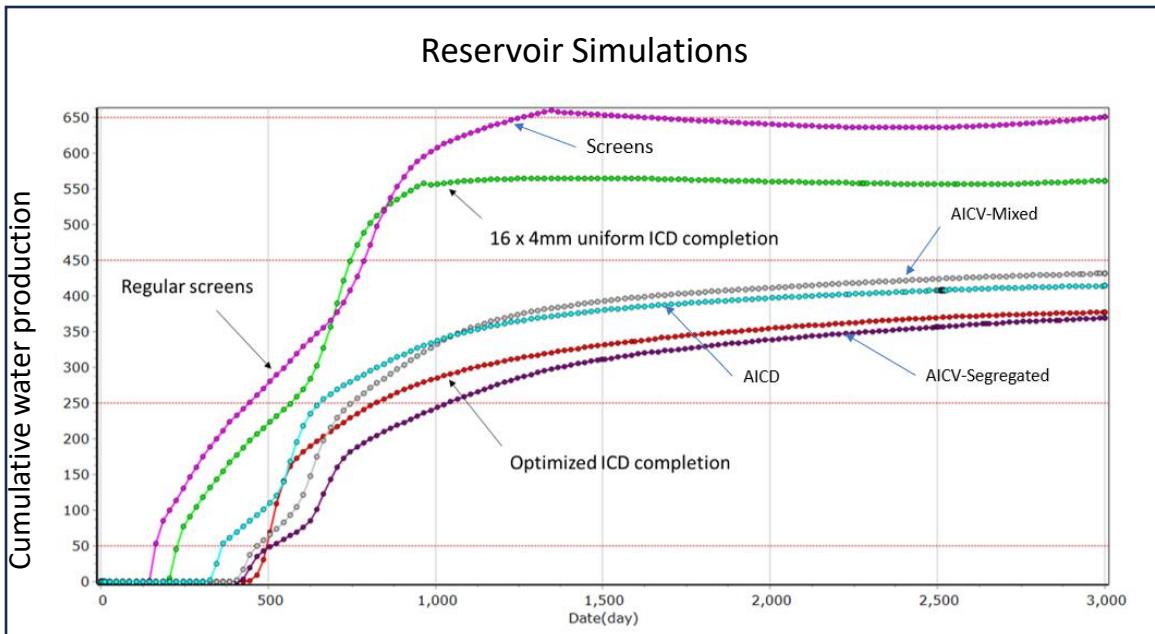

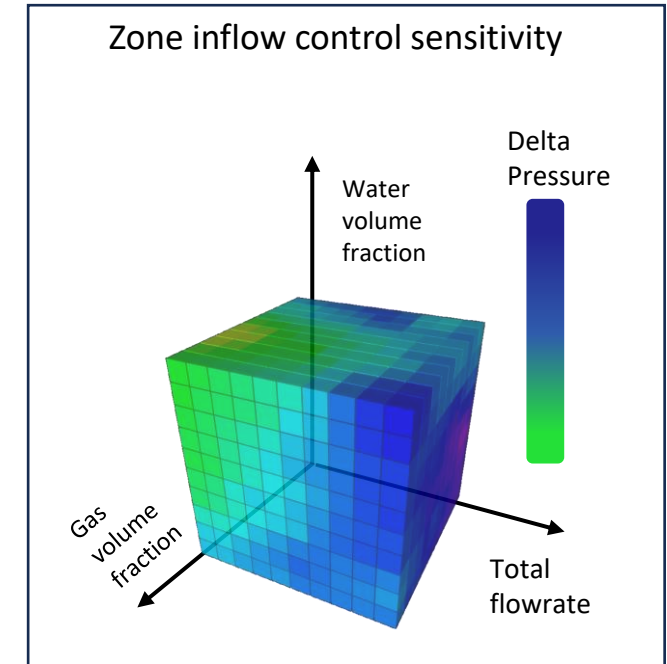

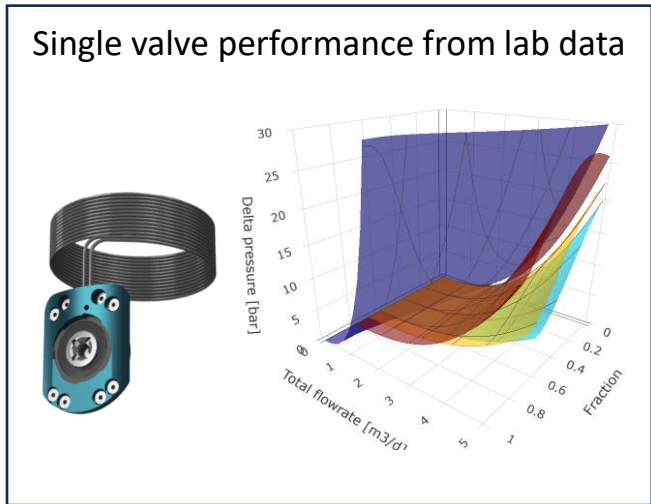

Well

1 2 3 4 5

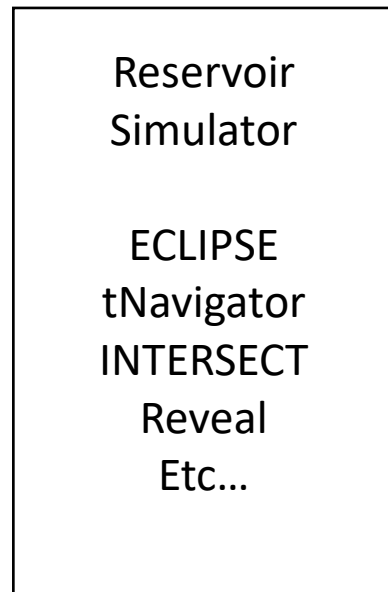

Detailed description: A yellow arrow points from the zone to a full-length 3D model of a wellbore. The wellbore is divided into five segments, numbered 1 to 5 from left to right. Segment 1 is purple, 2 is blue, 3 is light blue, 4 is green, and 5 is yellow. Segment 5 contains a valve. A dashed box highlights segments 2, 3, and 4.

From Lab Data to Production Profiles

Insight Software Environment

Reservoir

Petroleum Technology

Automatic work process is available in PetEx IPM 13.5

Insight - Single Zone Detailed Simulation - AICV

50% oil
50% water

$\angle 2$ degrees
100m

zone status

CHOKING

phase fraction

valve flowrate

Insight - Single Zone Detailed Simulation - AICV

Phase fractions through valves

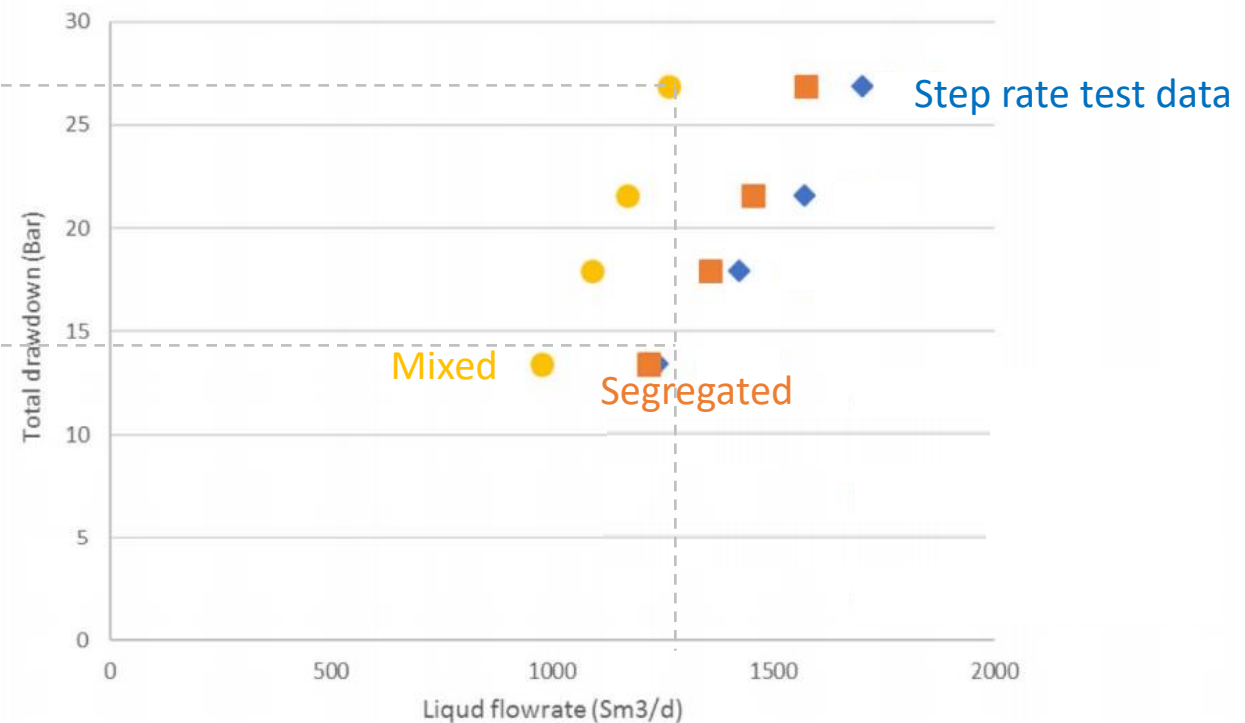

Total flowrate through valves

AICD (RCP) Segregated vs. Mixed Flow - SPE195617-MS

Step rate tests showed that pressure loss indicates segregation of liquid and gas in annulus Oseberg H-8 Y1Y2

Difference in simulated drawdown by omitting or including phase segregation in annulus

SPE-195617-MS, AICD Implementation on Oseberg H Vestflanken 2

Andreas Lien, Øyvind Midttveit, Atle Johnsen Gyllensten, and Martin Halvorsen, Equinor ASA

Ansys Fluent Validation Model

Size of mesh:
33.1 million cells

50% water and 50% oil
 Oil - density: 700 kg/m³ - viscosity: 0.5 cP
 Water - density: 1000 kg/m³ - viscosity: 0.4 cP
 Flowrate from reservoir = 48 m³/d
 Wellbore diameter: 8.5 in.
 Liner/screen OD: 6 in.
 Liner/screen ID: 4.92 in.
 0.2 deg. deviation from horizontal

4 evenly distributed static inflow control devices (ICD)

Flowpro Insight vs. Ansys Fluent Validation Model

	Number of Cores [-]	Computation time [h]	Simulation start time [s]	Simulation end time [s]	Resource coefficient (cores * computation time [h] / simulation time [s])
Fluent	160	22.25	3.407	91.46	40.429
Insight	1	1.185e-3 (4.26 s)	0	91.46	1.296e-5

Ratio of resource coefficients: 3 119 559

For this specific problem, **Insight is 3 million times faster than Ansys Fluent.**

Case with 0.2 deg. deviation from horizontal

Oil volume fraction along the annulus

Example - Reservoir modelling using the Insight work process

SPE-222361-MS • Autonomous Inflow Control Valve for Ultra-Light Oil and the Impact of Annulus Phase Segregation • K. Langaas

Bottom water drive
MULTPV=1e6

2000m horizontal well

Grid (m)	12.5*12.5*0.5
Porosity (frac.)	0.25
Permeability hor. (D)	1
Permeability vert. (D)	0.1

Upscaled AICV Zone Inflow performance from Insight

SPE-222361-MS • Autonomous Inflow Control Valve for Ultra-Light Oil and the Impact of Annulus Phase Segregation • K. Langaas

Oil-water mixtures

Oil-gas mixtures

Simulated steady state results with phase segregation

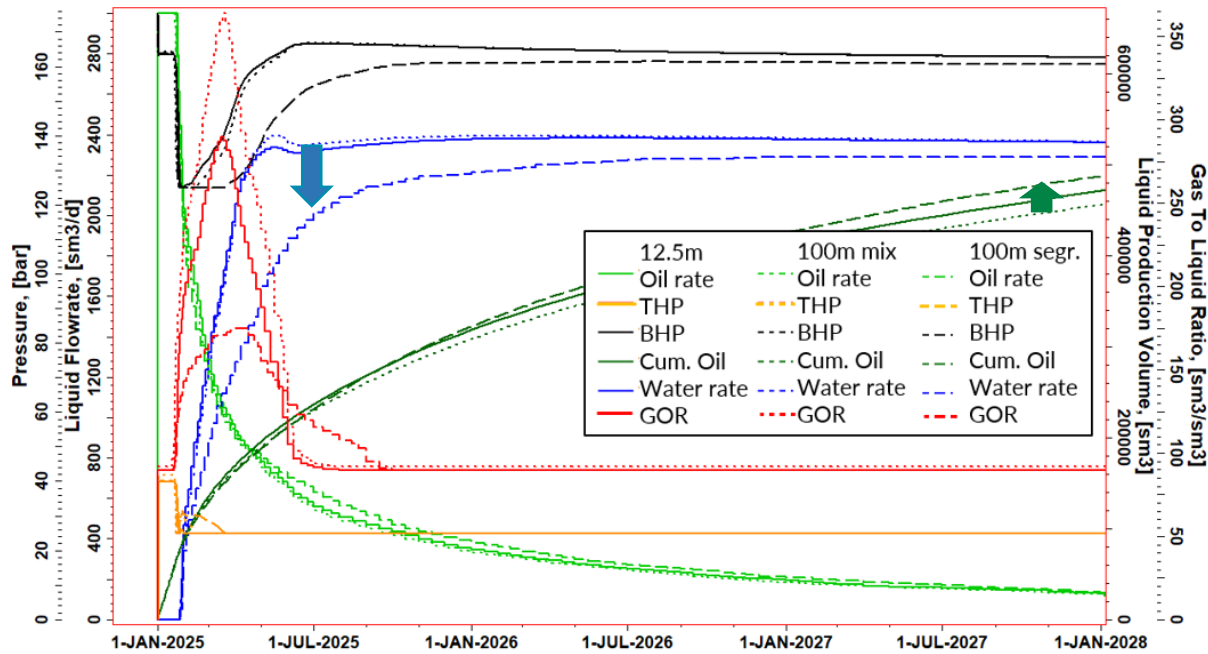

Fitted surface (VFP)

Results without phase segregation

Effect from new workflow on AICV and ICD modeling

SPE-222361-MS • Autonomous Inflow Control Valve for Ultra-Light Oil and the Impact of Annulus Phase Segregation • K. Langaas

- AICV - Performance underestimated with old workflow

- ICD - Performance overestimated with old workflow

Homogeneous reservoir model – with new workflow

SPE-222361-MS • Autonomous Inflow Control Valve for Ultra-Light Oil and the Impact of Annulus Phase Segregation • K. Langaas

- AICV case recovers 11.5% more oil and 8.7% less water

AICV and ICD performance comparison - Segregated vs. Mixed Flow in Annulus

SPE-222361-MS • Autonomous Inflow Control Valve for Ultra-Light Oil and the Impact of Annulus Phase Segregation • K. Langaas

With new workflow, AICV is the ICT of choice.

With old workflow, ICD would be the ICT of choice.

AICV outperforms ICD with segregated flow in annulus

ICD outperforms AICV with mixed flow in annulus

Use of new (Insight) vs. old workflow will influence

- The type of ICT equipment to be used
- The design of ICT solution (number and size)
